

BlockyMcBlockFace User Manual

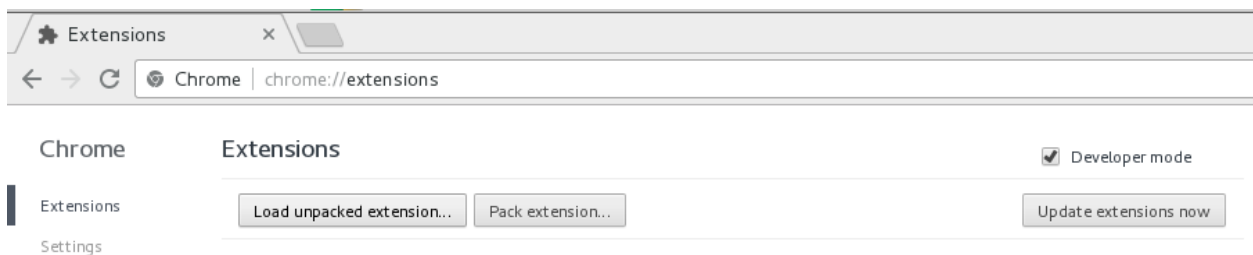

BlockyMcBlockFace is a Chrome extension that removes ads, scripts, images, and other unwanted web content that may contain malware.

Installation:

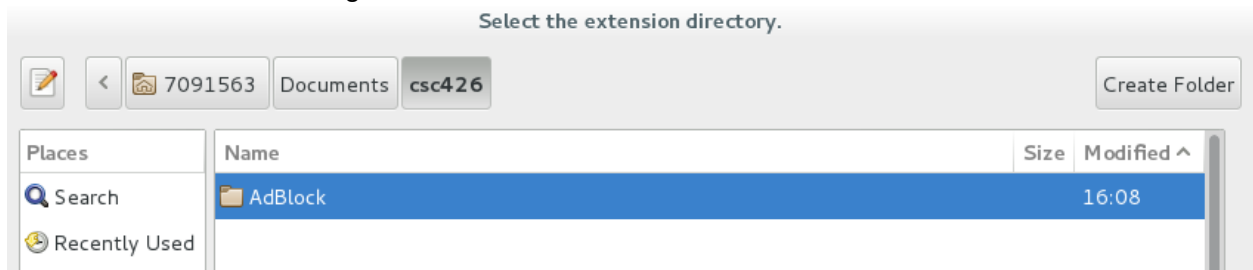

Download and extract the extension's tar file. In Google chrome, go to the extensions page in the settings menu.

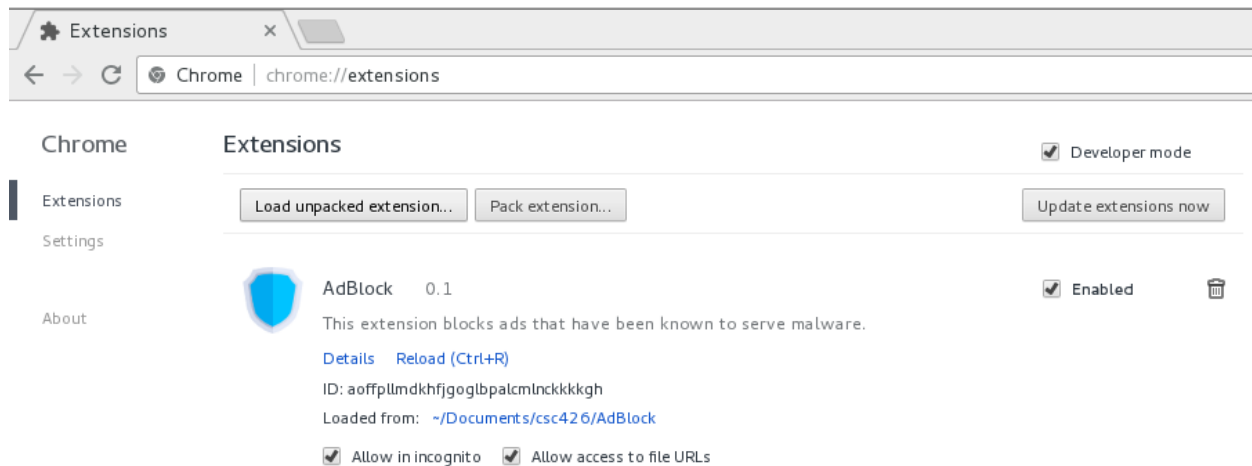

Click the “Load unpacked extension” button.

Select the folder containing the extension source code.

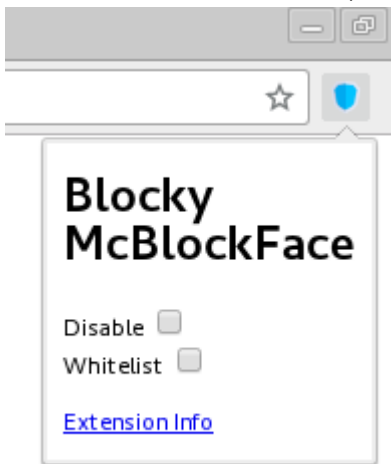

The extension is now installed. Note: If modifying the source code, click the reload extension option in the extension settings menu to reload the extension.

How to use:

The ad blocker will automatically run on page load once installed. By clicking on the extension icon you can add or remove the current site from a whitelist, or disable the blocker.

How it works:

The extension pre-parses the DOM to look for and remove script elements with domains that match any of the known ad domains stored in adArray.js. It also scrapes static page elements, to remove link, image, and ins tags with domains listed in the adArray list. When adding pages to the whitelist, a function is called when the whitelist box is checked, which checks whether the domain is already in the whitelist, and if not adds it. These settings persist across browsing sessions on the same machine.
